SedumPlug

General Information

Radmat SedumPlug are low maintenance, drought resistant, ready to install sedum plug plants grown in the UK to suit the environment climate. The range of species provides the opportunity to select plant mixes to achieve a variety of objectives including: extending the flowering season, managing degrees of shade or exposure, orientation and/or indigenous planting requirements.

Installation instructions

Install by hand into a suitably prepared and irrigated Radmat growing medium at the specified rate per m². Insert so root ball is below the finished growing medium surface. Once installed irrigate for the prescribed period based on season.

Fire performance

Approved Document B *Fire Safety* points to the DCLG document *Fire Performance of Green Roofs and Walls* for best practice guidance in achieving Regulation 7(2) fire compliance with a green roof. DCLG *Fire Performance of Green Roofs and Walls* states that the compliance requirements for achieving Broof(t4) are a growing medium layer of a minimum 80mm and an organic content of not more than 50% (<https://www.gov.uk/government/publications/fire-performance-of-green-roofs-and-walls>). In addition, The Green Roof Organisation (GRO) Code of Best Practice, also recommends fire breaks consisting of 50mm deep 20/40mm rounded ballast are used at perimeters and penetrations. Gravel fire/vegetation breaks should be 500mm wide where they abut habitable space but can be reduced to 300mm in some circumstances. Key to ensuring ongoing fire performance of a green roof, and the plant performance, is maintenance as some plants will die back, others will shed leaves naturally during their lifecycle and invasive species will try to take hold. These factors all create additional organic matter that could pose a fire spread risk on the roof therefore unwanted organic matter should be removed as part of the maintenance program.

Delivery

Delivery Form

Trays of plugs

Storage and transport

Delivered in a box or on a pallet. Store flat.
